Our modern fleet of video inspection units integrates the latest in computer technology with underground camera advancements to provide the customer with state of the art video media and reports.

Inspection is available for all sizes and types of underground pipelines. CCTV Inspections are performed using pan-and-tilt cameras powered by motorized tractors utilizing various methods of traction. These cameras conform to federal and state specifications.

Video and text data acquired during field inspections are delivered to the customer in various formats. All of our CCTV Inspection Trucks are manufactured by RS Technical Services and the software utilized is POSM. POSM is NASSCO PACP 4.2 Compliant. The POSM Software collection system has integrated with many GIS Programs so the CCTV Inspection data can be easily downloaded to our clients servers.
