An essential link in today's sewer system, manholes endure wear and tear on a daily basis. Manholes inspections include measurements, pictures, and observations on the general condition of the vital components such as cover, frame, wall, cone, bench, and channel. We use a special adjustable pole camera designed by Envirosight. Pictures and video clips are recorded and saved to media such as CD, DVD, or Hard Drives.

Customer specific data collection or MACP can be used to identify and record the features of each manhole. The POSM Software system incorporates the Manhole Assessment and Certification Program (MACP) which is part of the NASSCO Organization. The database and the video and photo files are combined and delivered to the customer in a digital media format.
